BEYOND AI ERA

KNOWLEDGE BASE OS

V1 - 700-page backend, SEO, AI and dashboard architecture

A dense applied blueprint for building a lovable, AI-powered intelligence consultant that reads agentic AI trends, evolves a knowledge base, creates three daily blogs, links products and services, visualizes knowledge in 3D, and feeds natural SEO growth through GSC intelligence.

Service layer: $60 Initial System Pilot | Brand voice: scientific hope, agentic evolution, semantic growth

Prepared for BEYOND AI ERA / Zouhair Moussaif

002. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

003. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

006. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL
Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL
Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

007. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

011. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

012. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

014. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

022. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

025. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL
Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL
Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

026. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

027. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

030. Strategic Positioning

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

BEYOND AI ERA must be positioned as a living knowledge infrastructure company: books, AI systems, agentic dashboards, and guided implementation, not a generic AI blog. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

038. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

041. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

044. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

045. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL
Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL
Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL
Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

046. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

052. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

053. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

054. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

056. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

057. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

061. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

062. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL
Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

064. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

065. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

068. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

069. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

071. Lovable Backend Architecture

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The build should use Lovable Cloud or Supabase-style primitives: PostgreSQL, auth, storage, realtime, edge functions, jobs, secrets, logs, and server-side AI calls. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

072. Source Intelligence Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

073. Source Intelligence Layer

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

075. Source Intelligence Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

080. Source Intelligence Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

085. Source Intelligence Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

088. Source Intelligence Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

089. Source Intelligence Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

092. Source Intelligence Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

101. Source Intelligence Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

104. Source Intelligence Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

105. Source Intelligence Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

106. Source Intelligence Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The source layer reads official docs, RSS feeds, GitHub public metadata, arXiv abstracts, Google Search Central updates, and selected AI agentic market sources. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

107. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

108. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

109. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

112. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

117. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

120. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

124. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

125. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

128. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

133. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL
Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL
Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

137. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

140. Agentic Market Radar

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The radar scores agentic AI trends by velocity, novelty, implementation maturity, commercial value, scientific depth, and fit with BEYOND AI ERA products. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

144. Knowledge Base Evolution

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

147. Knowledge Base Evolution

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL
Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

151. Knowledge Base Evolution

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

155. Knowledge Base Evolution

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

158. Knowledge Base Evolution

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

159. Knowledge Base Evolution

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

162. Knowledge Base Evolution

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

163. Knowledge Base Evolution

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

171. Knowledge Base Evolution

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL
Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL
Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL
Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

172. Knowledge Base Evolution

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

175. Knowledge Base Evolution

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

External signals become versioned KB cards with definitions, evidence, implications, objections, internal links, and future content recommendations. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

179. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

180. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

182. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

183. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

187. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

192. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

193. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

196. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

200. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

204. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

207. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL
Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL
Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

208. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

209. MCD/QMCD Cognitive Scoring

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, Noise, then display the score transparently. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Score every trend through Difference, Integration, Transferability, Agency, Proof, Compression, and Noise, then display the score transparently. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

212. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

216. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.
