Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

219. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

221. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

AI PROMPT CONTRACT

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

223. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

224. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

228. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

231. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

232. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

235. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

242. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

246. MCAI Processing Loop

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each output passes through extract difference, map complexity, route compute, generate alternatives, attack assumptions, repair weaknesses, test world-effect, and update memory. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

247. Quality Court

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

249. Quality Court

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

250. Quality Court

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

254. Quality Court

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

259. Quality Court

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

262. Quality Court

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

263. Quality Court

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

266. Quality Court

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

269. Quality Court

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

270. Quality Court

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

273. Quality Court

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

The Quality Court rejects unsupported claims, thin summaries, generic hype, forced selling, copied wording, weak examples, and SEO manipulation. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

282. Blog Factory

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

286. Blog Factory

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

289. Blog Factory

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

293. Blog Factory

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

295. Blog Factory

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

298. Blog Factory

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

301. Blog Factory

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

302. Blog Factory

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

305. Blog Factory

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

309. Blog Factory

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

314. Blog Factory

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate three daily draft blogs from top trend clusters, but keep human review and quality scoring before publication. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

317. GSC Intelligence

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

318. GSC Intelligence

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

321. GSC Intelligence

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

322. GSC Intelligence

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

325. GSC Intelligence

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. The AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

329. GSC Intelligence

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

333. GSC Intelligence

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

337. GSC Intelligence

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

341. GSC Intelligence

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Search Console data becomes a feedback stream that drives refreshes, internal links, book CTAs, sitemap checks, and content priorities. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

353. Sitemap Discipline

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

357. Sitemap Discipline

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

361. Sitemap Discipline

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

365. Sitemap Discipline

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

369. Sitemap Discipline

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

376. Sitemap Discipline

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

381. Sitemap Discipline

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

384. Sitemap Discipline

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Generate sitemap indexes, add a robots.txt sitemap line, submit sitemaps through Search Console API, and avoid deprecated ping workflows. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

385. Sitemap Discipline

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

389. Hreflang SEO

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

393. Hreflang SEO

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

397. Hreflang SEO

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

401. Hreflang SEO

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

407. Hreflang SEO

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

410. Hreflang SEO

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

414. Hreflang SEO

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

417. Hreflang SEO

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Keep /en/blog, /fr/blog, /ar/blog separated and connect language variants through hreflang groups and x-default when needed. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

422. Ebook Semantic Hub

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

423. Ebook Semantic Hub

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

426. Ebook Semantic Hub

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

429. Ebook Semantic Hub

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

430. Ebook Semantic Hub

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

434. Ebook Semantic Hub

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.
