Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

437. Ebook Semantic Hub

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL
Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

442. Ebook Semantic Hub

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

443. Ebook Semantic Hub

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

446. Ebook Semantic Hub

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

450. Ebook Semantic Hub

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Each ebook needs a semantic profile, related blog list, target reader, conversion CTA, and GSC-demand bridge. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

457. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

459. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

461. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

462. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

465. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

466. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

473. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

476. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

477. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

478. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

479. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

482. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

486. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

490. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Add the $60 Initial System Pilot as an entry service linked from blogs, ebooks, service pages, and relevant search-demand clusters. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

491. AI Systems Service Layer

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

493. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

494. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

498. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

501. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

502. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

505. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

509. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

510. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

514. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

517. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

518. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

519. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

521. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

525. 3D Knowledge Graph

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Represent sources, trends, KB cards, blogs, ebooks, queries, and services as high-performance nodes with filters and operational actions. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

529. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

533. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

534. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

537. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

541. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

544. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

545. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

549. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

553. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

555. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

556. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

557. Metrics Lab

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: kb_cards. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Create original metrics such as Knowledge Freshness Half-Life, Agentic Opportunity Delta, Query Intent Drift Vector, and Revenue Knowledge Resonance. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

565. Security Governance

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

569. Security Governance

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

570. Security Governance

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

573. Security Governance

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

574. Security Governance

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

577. Security Governance

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

586. Security Governance

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

589. Security Governance

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

593. Security Governance

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Use RLS, backend secrets, webhook validation, role-based access, logs, audit trails, source ethics, and safe publication status. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

597. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

601. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

605. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

609. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

610. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

613. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

617. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

621. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

622. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Semantic Demand Echo = query-page-book mismatch that reveals where a blog should link to an ebook or AI system. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: source_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

625. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to deduplicate by canonical URL and semantic hash. The result must include UI, backend function, database state, error handling, and a visible admin control.

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

628. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: ebooks. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

629. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

630. Operational Playbooks

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

DEFINITION

Daily ingestion, weekly quality review, monthly decay audit, sitemap health checks, source quality audits, and conversion experiments must be scheduled. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: cluster_items. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

633. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

637. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

638. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL
Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

641. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

642. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

645. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to generate three high-quality blogs after review. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

646. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

647. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

648. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: ai_systems. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

650. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

651. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL
Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

652. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

654. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

655. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK
Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE
Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE
Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR
Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL
Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST
Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE
Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL
Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE
Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP
Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT
Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE
Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

659. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to submit sitemap through supported API paths. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Revenue Knowledge Resonance = probability that a topic can convert into ebooks, AI systems, or the $60 pilot call. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: gsc_daily_metrics. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

663. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

664. Publishing Workflow

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: internal_links. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Draft, enrich, review, approve, publish, update sitemap, submit through allowed API, inspect URL status, and watch GSC feedback. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: prompt_runs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Natural Growth Integrity Index = evidence, originality, engagement, internal links, and anti-spam discipline in one score. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

667. Natural SEO Growth

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

DATA MODEL

Primary table focus: seo_actions. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

671. Natural SEO Growth

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

GSC FEEDBACK

Metric connection: Knowledge Freshness Half-Life = days until freshness-weighted impressions lose half their strength; refresh before authority decays. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

NEXT ITERATION
Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION
Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL
Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK
Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC
Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX
Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT
Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

676. Natural SEO Growth

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

GSC FEEDBACK

Metric connection: Agentic Opportunity Delta = market velocity minus current BEYOND AI ERA site coverage. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. When the AI generates content, it must return structured outputs: title, summary, claims, evidence URLs, objections, quality flags, internal link targets, and publishing recommendation.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: gsc_inspections. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to inspect canonical and robots states. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. Scientific hope means clarity without hype: explain the future, the limitation, the practical step, and the beginner path with confidence but not exaggeration.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

680. Natural SEO Growth

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

684. Natural SEO Growth

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive QA | revenue bridge

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: system_jobs. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The Quality Court must attack the output before users see it: unsupported claims, generic language, missing examples, weak CTA fit, duplicate pages, and thin SEO risk.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Crawl Readiness Pulse = sitemap, canonical, robots, URL inspection, lastmod, and internal depth combined. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

688. Natural SEO Growth

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

692. Natural SEO Growth

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

693. Natural SEO Growth

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Book-to-Blog Authority Bridge = estimated internal authority transfer from a performing blog to a relevant book/service page. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. Natural SEO growth emerges when search demand, internal knowledge, and product usefulness meet inside one coherent architecture.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. Every job must be observable: started, finished, failed, retried, skipped, cost estimate, source count, generated assets, and next suggested action.

DATA MODEL

Primary table focus: quality_reviews. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The 3D graph should make operational questions visible: which source created which trend, which trend generated which blog, which blog supports which ebook, and which query proves demand.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

697. Natural SEO Growth

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

LOVABLE BUILD TASK

Ask Lovable to log job status and AI costs. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Scientific Hope Signal = useful constructive insight divided by generic hype; keeps the voice strong and credible. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Create node types for sources, trends, KB cards, blogs, ebooks, queries, services, and actions. Animate knowledge flow with a 60 FPS target and low-power fallback.

SECURITY GUARDRAIL

Protect secrets, use RLS, validate inputs, require admin roles for publish and GSC actions, rate-limit ingestion, and store audit logs for every job.

ACCEPTANCE TEST

Test by running a source import, generating one KB card, drafting one blog, linking one ebook, updating sitemap, reading GSC mock data, and seeing nodes appear in 3D.

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. Use JSONB for flexible evidence and scoring explanations, but keep important status, slug, date, source, page, and relation fields relational for fast dashboards.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Query Intent Drift Vector = movement from informational language toward setup, pricing, implementation, and buying intent. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

700. Natural SEO Growth

V1 Knowledge Base OS | Lovable backend | GSC feedback | 3D graph | cognitive OA | revenue bridge

FAILURE MODE

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. If GSC data contradicts the assumed opportunity, the system must revise the KB card and reduce confidence rather than forcing a marketing conclusion.

DATA MODEL

Primary table focus: trend_clusters. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to create tables with RLS and indexes. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

MCAI LOOP

Extract the active difference, map complexity, route compute, generate alternatives, attack assumptions, repair the output, test world-effect, and update memory.

QUALITY COURT

Reject if generic, unsupported, copied, too vague, too technical without explanation, too salesy, missing internal relation, or unsafe for natural SEO growth.

SEO RULE

Use canonical URLs, language-specific routes, clean slugs, structured data, sitemap lastmod, internal anchors, noindex drafts, and human approval before public indexing.

GSC FEEDBACK

Metric connection: Trend-to-Page Latency = time between first trend detection and first useful published page; lower is stronger. Show raw fields, formula, confidence, trend direction, and action. Do not claim Google provides synthetic metrics directly.

INTERNAL LINK RULE

Create links only when helpful. Anchor text must match reader intent and semantic fit. Prefer book/service links when GSC queries reveal real demand.

BOOK/SERVICE BRIDGE

Relate the topic to ebooks, Knowledge Base OS, AI systems, and the $60 Initial System Pilot only when the reader gains a clear next step.

3D GRAPH BEHAVIOR

Failure risks: stale source, duplicate trend, hallucinated citation, low-value blog, wrong canonical, weak hreflang, API quota, exposed secret, or forced conversion link.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. This is an applied engineering rule, not decoration. The admin must see what changed, why it matters, which evidence supports it, what risks remain, and what action should happen next.

DATA MODEL

Primary table focus: blog_posts. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to route AI calls through backend edge functions. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.

DASHBOARD UX

Show this module as a card, table, drill-down page, timeline, and 3D node. The admin should understand status, cause, confidence, and next action in one glance.

AI PROMPT CONTRACT

Output contract: summary, claims, evidence_urls, objections, quality_flags, internal_link_targets, book_targets, service_targets, score_explanation, and recommended_action.

MCD/QMCD SCORE

Calculate Difference, Integration, Transferability, Agency, Proof, Compression, Noise. Explain each score and avoid hiding weak evidence behind a beautiful number.

NEXT ITERATION

Next iteration: add better source scoring, cost control, multilingual editorial review, stronger schema validation, and source-specific trust calibration.

DEFINITION

Pages are created when a real knowledge gap, source-backed trend, reader need, and internal asset relation exist. The system should prefer fewer excellent pages over many weak pages. Every page must prove usefulness through evidence, practical steps, internal relevance, and a clear reader path.

DATA MODEL

Primary table focus: sources. Add id, slug or key, status, timestamps, source references, confidence fields, JSONB evidence, and relational indexes for dashboard speed.

LOVABLE BUILD TASK

Ask Lovable to prevent noindex drafts from public sitemap. The result must include UI, backend function, database state, error handling, and a visible admin control.

EDGE FUNCTION LOGIC

Run sensitive work server-side: source fetch, GSC calls, sitemap submission, AI generation, webhooks, scoring, and scheduled jobs. Return structured JSON and log every failure.
