# Moussaif Global Outreach AGI Task-Mesh: Operational Protocol

## 1. Canonical Brand Identity and Public Presence

The operating environment is strictly governed by the commercial identity **Afripa Beyond AI Systems** under the primary public leadership and representation of **Zouhair Moussaif** [1]. The legacy identifier **Beyond AI Era** is strictly deprecated for all external communications and public commercial positioning, preserved solely for historical provenance in legacy logs [1].

The primary public entry point, canonical website, and primary Call-To-Action (CTA) url for all commercial, research, and outreach interactions is:

> **https://moussarch-mnwcipya.manus.space/** [2]

Secondary scheduling links may be utilized exclusively when explicitly requested by a counterparty, whereas generic contact endpoints (such as `info@` or raw web forms ) represent low-priority fallback channels in favor of direct decision-maker engagement [2].

---

## 2. Multi-Lane Task-Mesh Architecture

To maintain systematic efficiency, prevent collisions, and enforce rigorous separation of concerns, the operating system executes through four specialized intelligence and execution lanes, coordinated by a central routing authority [3].

| Lane ID | Role Title | Core Mission | Primary Target Profiles / Outputs |
|---|---|---|---|
| **T01** | `CONTROL_OWNER` | Global routing, quota arbitration, state persistence, CRM authority, and collision prevention. | System state synchronization, duplicate suppression, audit logging, and degraded-mode detection [3]. |
| **T02** | `GLOBAL_SALES_OWNER` | Commercial acquisition and high-value B2B outreach for **Afripa Beyond AI Systems**. | Enterprises, financial institutions, fintech, telecom, energy, logistics, healthcare, and enterprise software leadership (CEO, CTO, CIO, CDO, |

| | | | |
|---|---|---|---|
| | | | Head of AI/Automation) [4]. |
| **T03** | `GROWTH_DISCOVERY_OWNER` | Global opportunity reservoir replenishment and continuous source intelligence. | 450+ discovery sources, funding detection, hiring signal extraction, procurement tracking, and advanced contact enrichment [5]. |
| **T04** | `RESEARCH_OWNER` | Elite scientific relationships and collaborative research around reliable agentic AI systems. | University outreach, sponsored research labs, AI safety researchers, verification frameworks, and academic external relations [6]. |

---

## 3. The F-A-T-T-A-H Execution Doctrine

All operational cycles within the local task-mesh strictly adhere to the **F-A-T-T-A-H Loop** framework for structured problem decomposition and execution reliability [7]:

1. **Frame**: Define the real objective, affected systems, external constraints, and verified value criteria before taking action [7].
2. **Atomize**: Breakdown complex mechanisms, inter-dependencies, technical unknowns, and potential failure pathways into discrete tasks [7].
3. **Triangulate**: Cross-reference current observed state against the local knowledge base and historical execution traces [7].
4. **Test**: Evaluate underlying assumptions, potential contradictions, counterfactual scenarios, and safety boundaries [7].
5. **Act**: Execute through the smallest complete, reversible, and verifiable local plan or bounded external step [7].
6. **Harvest**: Record verification outcomes, update the project world model, extract reusable patterns, and capture failure lessons [7].

---

## 4. Governance, Safety Invariants, and Authorization Gates

To ensure strict adherence to safety and ethical standards, all execution tiers operate under the **PUBLISH_MODE=review_required** constraint [8].

- **T0-T1 (Observation and Bounded Reasoning)**: Read-only discovery, knowledge retrieval, local simulation, and internal artifact generation are permitted autonomously [8].
- **T2-T4 (State Mutation and External Effects)**: Any external outreach send, financial commitment, credential modification, public publishing, or irreversible deployment **strictly requires explicit human review and approval** [8].
- **Deduplication and Idempotency**: Prior to any communication or outreach send, the control lane (`T01`) must verify CRM records and Gmail thread histories to completely eliminate duplicate messages or violation of suppression lists [3].
